

Discussion about the development test to prevent discoloration of seaweed.

Discussion about the development test to prevent discoloration of seaweed was held with Uchinomi Fisheries Cooperatives, Kagawa Prefectural Fisheries Experiment Station, Kagawa Prefectural Fisheries Division, Seto Inland Sea Regional Research Center in Kagawa University and others.

Up to now, we have devised a fertilizer application using skirt covering the seaweed aquafarm inside the bay for countermeasure against discoloration of seaweed, and finished it to be effective by improvements through field trials.

Subsequently, we have been working on measures for discoloration in the fast tide current place at outside the bay where it is difficult to apply the skirt since last fiscal year. So we devised new fertilizer application system for using there and we planed field trial from this fall.

The meeting was for preparation to this coming winter field trial.
